

Katabatic Mentorship Repository

Guide to Creating a Branch and Pushing Model Code

This document outlines the correct procedure for contributing model code to the Katabatic mentorship repository.

All contributors are required to work on their own branch to avoid conflicts and maintain repository stability.

1. Cloning the Repository

- Open **Visual Studio Code**.
- From the start screen, select Clone Git Repository...
- Alternatively, press Ctrl + Shift + P (Windows/Linux) or Cmd + Shift + P (macOS) to open the command palette.
- Choose **Git: Clone**.
- Paste the **GitHub repository URL** and press **Enter**.
- Select a local directory where the repository should be saved.
- When prompted, allow Visual Studio Code to open the cloned repository.

2. Creating a Branch from Main

Each contributor must create a personal branch from main.

1. In the bottom-left corner of Visual Studio Code, click on the current branch name (main).
2. Select **Create new branch**.
3. Choose **from main**.
4. Name the branch using your own name

3. Opening the Terminal

1. In Visual Studio Code, select **Terminal → New Terminal**.
2. Any terminal may be used (VS Code Terminal, Git Bash, PowerShell, or Command Prompt).

Note: Git commands behave the same across all terminals. The only difference is how file paths are written on Windows systems.

4. Copying the Model Folder into the Repository

- The model directory must be placed inside the katabatic/models folder of the mentorship repository.
- A recursive copy command is used to move the model directory from a local development version of Katabatic into the mentorship repository.

Example command:

```
cp -r <path_to_local_katabatic>/katabatic/models/<model_name> katabatic/models/
```

Notes:

- Replace <path_to_local_katabatic> with the location of your local Katabatic project.
- Replace <model_name> with the name of your model directory.
- Ensure the destination path is katabatic/models/.

If a “No such file or directory” error occurs, verify that the source path and folder names are correct.

5. Staging the Files

- Add the new model files to Git tracking:
git add katabatic/models/<model_name>

6. Committing the Changes

- Commit the changes with a clear and descriptive message:
git commit -m "Add <model_name> model implementation"

7. Pushing the Branch to GitHub

- Push the personal branch to the remote repository:
git push origin yourname
- Replace yourname with the name of your personal branch.

8. Verification

To verify the push:

1. Open the repository on GitHub.
2. Use the branch dropdown to select your branch.
3. Confirm that your model folder is visible.

9. Important Contribution Guidelines

- Do not push directly to main.
- Always work on a personal branch.
- Push only your own model directory.
- Do not modify or rename other contributors' files.

The correct workflow is:

Clone the repository, create a branch from main, copy the model directory into katabatic/models, commit the changes, and push the branch to GitHub.
