

Katabatic - Windows Setup Guide (PowerShell Method)

This guide provides step-by-step instructions for setting up and running the Katabatic pipeline on Windows using the PowerShell method.

1. Open Windows PowerShell

- Open the Start menu, search for **Windows PowerShell**, and launch it.

2. Clone the Katabatic repository

- If Git is installed, run the following command in PowerShell:
- `git clone https://github.com/DataBytes-Katabatic/Katabatic.git`
- `cd Katabatic`
- If you downloaded the ZIP file instead, extract it and navigate to the folder:
- `cd "C:\Users\<UserName>\Downloads\Katabatic"`

3. Allow PowerShell to run scripts (temporary setting)

- Run this command to enable script execution for the current session:
- `Set-ExecutionPolicy -Scope Process -ExecutionPolicy Bypass`

4. Activate the Katabatic virtual environment (Poetry)

- Replace <UserName> with your Windows username and run:
- `& "C:\Users\<UserName>\AppData\Local\pypoetry\Cache\virtualenvs\katabatic-*\Scripts\Activate.ps1"`
- Once activated, your prompt will look like this:
- `(katabatic-py3.11) PS C:\Users\<UserName>>>`

5. Install project dependencies

- Make sure you are inside the Katabatic project folder, then run:
- `poetry install`
- This installs all required packages for the project.

6. Verify that Katabatic is installed correctly

- Run the following command to confirm the environment is working:
- `python -c "import katabatic; print('Katabatic working!')"`
- If everything is set up correctly, you will see:
- `Katabatic working!`

7. TensorFlow installation issue (common on Windows + Poetry)

- Sometimes you may face errors when installing **TensorFlow** inside a Poetry environment on Windows.
This happens because Poetry may block some TensorFlow dependencies.
- If this occurs, you can fix it by installing TensorFlow I/O manually:
- `poetry add tensorflow-io == 0.31.0`
- This will update the environment and resolve the error.

```

PS C:\Users\Prabu\Downloads\Katabatic> poetry shell

Looks like you're trying to use a Poetry command that is not available.

Since Poetry (2.0.0), the shell command is not installed by default. You can use,

- the new env activate command (recommended); or
- the shell plugin to install the shell command

Documentation: https://python-poetry.org/docs/managing-environments/#activating-the-environment

Note that the env activate command is not a direct replacement for shell command.

PS C:\Users\Prabu\Downloads\Katabatic> poetry add tensorflow-io==0.31.0

Updating dependencies
Resolving dependencies... (3.8s)

Package operations: 24 installs, 0 updates, 0 removals

- Installing tensorflow-io-gcs-filesystem (0.31.0)
- Installing comm (0.2.2)
- Installing debugpy (1.8.14)
- Installing ipython (9.3.0)
- Installing jupyter-client (8.6.3)
- Installing mypy-extensions (1.1.0)
- Installing nest-asyncio (1.6.0)
- Installing pathspec (0.12.1)
- Installing psutil (7.0.0)

```

8. Run the pipeline

- Once the environment is activated and dependencies are installed, you can run your model pipeline as required.
After execution, the results will be saved automatically in the project's Results folder.
- Example output:
- Results saved to: Results/<dataset>/<model>_tstr.csv
- This confirms that the pipeline has completed successfully.
